

MailProtect

ATOMWIDE
MANAGED SERVICES

www.atomwide.com info@atomwide.com

Email is a convenient and efficient communication tool but the features that make it so useful also make it the perfect way to deliver unsolicited advertising, viruses and other threats. To protect against these, and more, MailProtect provides a comprehensive filtering solution that can be applied to any mail system to ensure it remains reliable, efficient and safe.

MailProtect scans over 2 million emails each day

Features

- ✓ Inbound and Outbound email filtering
- ✓ 24-hour background protection
- ✓ Scans for viruses and spam
- ✓ Protects against phishing and denial of service attacks
- ✓ Customisable content rules
- ✓ Easy-to-use and configure via a dedicated website
- ✓ Daily spam report emails for all users
- ✓ Included support from the Atomwide Service Desk

World-class email filtering

It is clear that the content of some emails can be inappropriate, sometimes causing offence and irritation and exposure to unacceptable material. However, there is also the risk of leaking sensitive information, slowing your network, or even corrupting your local IT systems.

MailProtect protects against all types of email threat including viruses, spam and pornography - as well as less well known but equally insidious dangers like phishing and denial of service attacks.

The system uses email filtering technology provided by multiple world-class security partners that is assembled into a coherent set of tools accessible via a custom online interface. By employing antivirus scanning products in this way MailProtect is able to help recognise existing and also new dangers such as 'zero-day' attacks.

Today's 'spammers' are becoming more sophisticated with many attacks now intended to cause disruption and obtain information for financial gain. This makes combating and blocking spam attacks more complicated but as MailProtect is able to be applied to any existing email system it will protect users and help keep your network running smoothly.

Daily spam digest

Individual school users will receive a daily report, in the form of a single email, which lists spam messages that have been trapped in the past 24 hours. This helps ensure that no important messages are being lost in the system.

Additional functionality exists for users to also log into the custom online management interface and view a log of scanned messages relating to any of their personal email addresses. The details of any emails blocked by MailProtect can be examined, and 'false positives' can be released (unless they are believed to contain viruses). Any blocked trusted senders can then be added to a personal 'allow' list so that future messages are exempt from spam checks.

Secure online management tools

For Domain Administrators the online management interface provides a range of options for controlling the filtering system (perhaps to allow or block all messages originating from a specific sender), viewing the message logs, and gathering statistics about system usage.

The service maintains comprehensive logs that are fully searchable, allowing all messages sent to or from specific addresses to be identified and further details such as date stamps and filtering outcomes to be seen. Trapped messages can also be safely previewed and released from quarantine if necessary.

Reporting

Reporting facilities are extensive and include the ability to export log records as well as the visualisation of throughput data in a variety of graphical styles which allows the systems performance to be checked, proportions of infected and unsolicited mail to be seen and the rankings of most popular inbound and outbound email addresses to be calculated.
